

- PRESS RELEASE -

Transform™ Scan Centre : Intelligent data capture automation based on simple business rules enabling barcode and key-from-image matching.

Markham, ON – September 9, 2008 - Litco Systems Inc. announces the release of the new **Transform™ Scan Centre** Software from Bottomline Technologies.

Transform™ Scan Center delivers basic intelligent data capture automation based on simple business rules enabling barcode and key-from-image matching. Documents are then stored in a document repository solution for easy access and retrieval.

Transform Scan Center uses an automatic discovery mechanism to query the Transform Content Center server for current Content and Index information. Transform Scan Center supports the Presenter data types Integer, Decimal and Date Time. For both the Decimal and Integer type validations, there is a new communication configuration option to select a currency format. This selection allows the correct decimal character to be used during type validations.

Transform Scan Center includes automatic squaring of TIF images prior to export. Images scanned with different horizontal and vertical DPI sizes can cause the system to hang when creating a PDF from these odd-shaped images. The squaring feature converts images scanned X by Y DPI to the larger of the two values. For example, images at 100 x 200 dpi or 200 x 100 DPI are both converted to 200 x 200 DPI images.

The Grouping panel now controls the available thumbnails size based on the page image count. This enhancement prevents the thumbnail display from becoming unstable with very large page-count batch sizes. In the Grouping panel when working with large batch sizes, the Done/Classify button is now disabled after the first click to prevent the user from accidentally causing problems if they selected the button more than once. When Transform Content Center is the selected export, the Indexing panel now displays to the user which indexes are mandatory.

Transform Scan Center supports a Custom export option. While the Scan-to-archive option creates one PDF file for each scanned document delivered to Transform Content Center, the Custom export option creates one PDF or multi-page TIF file for each scanned document delivered to a shared network directory. The custom export option is defined per Functional Profile, and therefore a single Transform Scan Center installation can support a combination of scan-to-archive Functional Profiles and custom export Functional Profiles.

About Litco Systems Inc.

Litco Systems Inc. is a recognized expert in enterprise software, providing a comprehensive set of solutions including document management and business intelligence software. Litco Systems has offices in Vancouver, Toronto, and Montreal.
